**AN AMERICAN NATIONAL STANDARD**

**The American Society of  
Mechanical Engineers**

Three Park Avenue • New York, NY 10016

Date of Issuance: August 31, 2006

The next edition of this Standard is scheduled for publication in 2010. There will be no addenda or written interpretations of the requirements of this Standard issued to this edition.

ASME is the registered trademark of The American Society of Mechanical Engineers.

This code or standard was developed under procedures accredited as meeting the criteria for American National Standards. The Standards Committee that approved the code or standard was balanced to assure that individuals from competent and concerned interests have had an opportunity to participate. The proposed code or standard was made available for public review and comment that provides an opportunity for additional public input from industry, academia, regulatory agencies, and the public-at-large.

ASME does not "approve," "rate," or "endorse" any item, construction, proprietary device, or activity.

ASME does not take any position with respect to the validity of any patent rights asserted in connection with any items mentioned in this document, and does not undertake to insure anyone utilizing a standard against liability for infringement of any applicable letters patent, nor assumes any such liability. Users of a code or standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, is entirely their own responsibility.

Participation by federal agency representative(s) or person(s) affiliated with industry is not to be interpreted as government or industry endorsement of this code or standard.

ASME accepts responsibility for only those interpretations of this document issued in accordance with the established ASME procedures and policies, which precludes the issuance of interpretations by individuals.

No part of this document may be reproduced in any form,  
in an electronic retrieval system or otherwise,  
without the prior written permission of the publisher.

## FOREWORD

In 1894, the American Society of Mechanical Engineers (ASME) adopted a standard flange template ("ASME Standard") for low-pressure service. A "Manufacturers Standard" for pressures up to 250 psi followed in 1901. Around 1910, a group of fittings manufacturers formed an organization that was the forerunner of the present Manufacturers Standardization Society of the Valve and Fittings Industry (MSS) and undertook the design of a line of flanged fittings. A document covering this work was published in 1912.

During the years 1912–1914, a Joint Committee of the ASME and the Manufacturers Committee formulated compromise standard dimensions for pipe flanges and flanged fittings for use under saturated steam pressures of 125 psi and 250 psi pressure ranges. The Joint Committee's report was accepted at a conference attended by representatives of ASME, the Manufacturers Committee, the U.S. government, and the National Association of Master Steam and Hot Water Fitters. ASME published this report as the "American Standard for Pipe Flanges, Fittings and Their Bolting" in 1914. In 1918, work was started on standards for 50 lb steam flanges and for 800 lb, 1,200 lb, and 3,000 lb hydraulic flanges, which were subsequently approved by this group.

In 1921, the American Engineering Standards Committee, later known as the American Standards Association (ASA), United States of America Standards Institute (USAS), and more recently, the American National Standards Institute (ANSI), organized Sectional Committee B16 to unify and further develop national standards for pipe flanges and fittings (and later for valves and gaskets). Cosponsors of the B16 Committee were ASME, MSS, and the Heating and Piping Contractors Association [now the Mechanical Contractors Association of America (MCAA)]. Work already in progress on flanges and flanged fittings was assigned to Subcommittee 1 (now Subcommittee A). Following approval by the Subcommittee, the B16 Committee, the cosponsors, and ASA, the standards were published in 1928.

In later work, Subcommittee 1 developed the 25 lb Flange and Flanged Fitting Standard (approved in 1931 as ASA B16b2), which replaced the 50 lb standard that had been originally approved in 1918. Work on the 800 lb Hydraulic Flange Standard was published as ASA B16b1 in 1931. Revision of thicknesses, tolerances, and service pressure ratings of the 125 lb and 250 lb flanges and flanged fittings led to approval and publication of ASA B16a-1939.

An American war standard entitled "Pressure Ratings for Cast Iron Flanges and Flanged Fittings, 125 lb" (ASA B16a1) was published in 1943. A complete review of the 125 lb and 250 lb standards resulted in new editions of each: ASA B16.1-1948 and ASA B16.2-1948. In 1960, editions of B16.1 and B16.2 were issued in which ratings were presented in graphic form and special requirements were added for testing flanges.

A review of all gray iron flange and flanged fittings standards initiated in 1962 resulted in the withdrawal of B16.16, "300 lb Refrigerant Flanges and Flanged Fittings" and the combining of the remaining standard into a single document, with B16.1 and B16.2 coming together as USAS B16.1-1967. In this edition, the presentation of ratings was restored to tabular form.

The increasing use of higher grades of gray iron necessitated the establishment of a second set of ratings for the smaller sizes. A revised edition published as ANSI B16.1-1975 incorporated these new ratings along with metric (SI) equivalents for dimensions and minor corrections to the 1967 edition text.

In 1982, American National Standards Committee B16 was recognized as an ASME Committee operating under procedures accredited by ANSI. Following approval by the ASME B16 Subcommittee A and B16 Committee, ANSI approved ASME/ANSI B16.1-1989 on March 8, 1989. Changes included revised marking requirements, revised bolt length increments ( $\frac{1}{2}$  in. rather than  $\frac{1}{4}$  in.), elimination of metric equivalents, a correction of the Class 800 flange raised-face height to 0.25 in. from the 0.06 in. shown previously, and editorial changes to the text.

In the 1998 edition of ASME B16.1, Reference Standards have been updated, a Quality System Program Annex has been added, Class 800 has been deleted, and several editorial revisions have

been made. Following approval by ASME B16 Subcommittee B and B16 Main Committee, ANSI approved this American National Standard on November 20, 1998.

Work was started in 1999 to revise the standard to include metric units as the primary reference units while maintaining U.S. Customary units in either parenthetical or separate forms. The goal is to delete the U.S. Customary units when the standard is next issued. Following approval of the Standard Committee and ASME, approval as an American National Standard was given by ANSI on July 8, 2005, with the new designation ASME B16.1-2005.

All requests for interpretation or suggestions for revision should be sent to the Administrative Secretary B16. The American Society of Mechanical Engineers, Three Park Avenue, New York, NY 10016-5990.

**W. N. McLean**, Newco Valves  
**J. K. Schultz**, Conine Manufacturing Co., Inc.

# CORRESPONDENCE WITH THE B16 COMMITTEE

**General.** ASME Standards are developed and maintained with the intent to represent the consensus of concerned interests. As such, users of this Standard may interact with the Committee by requesting interpretations, proposing revisions, and attending Committee meetings. Correspondence should be addressed to:

Secretary, B16 Standards Committee  
The American Society of Mechanical Engineers  
Three Park Avenue  
New York, NY 10016-5990

**Proposing Revisions.** Revisions are made periodically to the Standard to incorporate changes that appear necessary or desirable, as demonstrated by the experience gained from the application of the Standard. Approved revisions will be published periodically.

The Committee welcomes proposals for revisions to this Standard. Such proposals should be as specific as possible, citing the paragraph number(s), the proposed wording, and a detailed description of the reasons for the proposal, including any pertinent documentation.

**Interpretations.** Upon request, the B16 Committee will render an interpretation of any requirement of the Standard. Interpretations can only be rendered in response to a written request sent to the Secretary of the B16 Standards Committee.

The request for interpretation should be clear and unambiguous. It is further recommended that the inquirer submit his/her request in the following format:

Subject:	Cite the applicable paragraph number(s) and the topic of the inquiry.
Edition:	Cite the applicable edition of the Standard for which the interpretation is being requested.
Question:	Phrase the question as a request for an interpretation of a specific requirement suitable for general understanding and use, not as a request for an approval of a proprietary design or situation. The inquirer may also include any plans or drawings, which are necessary to explain the question; however, they should not contain proprietary names or information.

Requests that are not in this format will be rewritten in this format by the Committee prior to being answered, which may inadvertently change the intent of the original request.

ASME procedures provide for reconsideration of any interpretation when or if additional information that might affect an interpretation is available. Further, persons aggrieved by an interpretation may appeal to the cognizant ASME Committee or Subcommittee. ASME does not "approve," "certify," "rate," or "endorse" any item, construction, proprietary device, or activity.

**Attending Committee Meetings.** The B16 Standards Committee regularly holds meetings, which are open to the public. Persons wishing to attend any meeting should contact the Secretary of the B16 Standards Committee.

# GRAY IRON PIPE FLANGES AND FLANGED FITTINGS

## Classes 25, 125, and 250

### 1 SCOPE

#### 1.1 General

This Standard covers Classes 25, 125, and 250 Gray Iron Pipe Flanges and Flanged Fittings. It includes:

- (a) pressure-temperature ratings;
- (b) sizes and method of designating openings of reducing fittings;
- (c) marking;
- (d) materials;
- (e) dimensions and tolerances;
- (f) bolting and gaskets;
- (g) pressure testing.

#### 1.2 References

Standards and specifications adopted by reference in this Standard are shown in Appendix II, which is part of this Standard. It is not considered practical to identify the specific edition of each referenced standard and specification in the text, when referenced. Instead, the specific editions of the referenced standards and specifications are listed in Appendix II.

#### 1.3 Quality Systems

Requirements relating to the product manufacturer's Quality System Programs are described in Appendix A.

#### 1.4 Relevant Units

This Standard states values in both SI and U.S. Customary units. As an exception, diameter of bolts and flange bolt holes are expressed in inch units only. These systems of units are to be regarded separately. Within the text, the U.S. Customary units are shown in parenthesis or in separate tables. The values stated in each table are not exact equivalents; therefore it is required that each system of units be used independently of the other. Except for diameter of bolts and flange bolt holes, combining values from the two systems constitutes nonconformance with the standard.

#### 1.5 Service Conditions

Criteria for selection of materials suitable for particular fluid service are not within the scope of this Standard.

#### 1.6 Convention

For the purpose of determining conformance with this Standard, the convention for fixing significant digits where limits, maximum and minimum values are specified, shall be rounded as defined in ASTM E 29. This

requires that an observed or calculated value shall be rounded off to the nearest unit in the last right hand digit used for expressing the limit. Decimal values and tolerance do not imply a particular method of measurement.

### 1.7 Denotation

**1.7.1 Pressure Rating Designation.** Class, followed by a dimensionless number, is the designation for pressure-temperature ratings as follows:

Class	25	125	250
-------	----	-----	-----

**1.7.2 Size.** NPS, followed by a dimensionless number, is the designation for nominal flange or flange fitting size. NPS is related to the reference nominal diameter, DN, used in international standards. The relationship is, typically, as follows:

NPS	DN
1	25
1½	32
1¾	40
2	50
2½	65
3	80
3½	...
4	100

For  $\text{NPS} \geq 4$ , the related DN is:  $\text{DN} = 25 \times (\text{NPS})$

## 2 PRESSURE-TEMPERATURE RATINGS

#### 2.1 General

Pressure-temperature ratings are maximum allowable working pressures in bar units at the temperature in degrees Celsius shown in Table 1 for the applicable material and class designation. Table I-1 of Appendix I lists pressure-temperature ratings using psi units for pressure at the temperature in degrees Fahrenheit. For intermediate temperatures, linear interpolation is permitted. Interpolation between class designations is not permitted.

#### 2.2 Flanged Joints

A flanged joint is composed of independent interrelated components; the flanges, the gasket, and the bolting, that are assembled manually. Proper controls must be exercised in the selection and application for these

elements to attain a joint that has acceptable leak tightness. Special techniques, such as controlled bolt tightening described in ASME PCC-1, may be used to achieve a tight joint in service.

### 2.3 Rating Temperature

Temperatures shown for the corresponding pressure rating shall be the material temperature of the pressure-retaining structure. It may be assumed that the material temperature is the same as the fluid temperature. Use of a pressure rating at a material temperature other than that of the contained fluid is the responsibility of the user and subject to the requirements of any applicable code or regulation.

### 2.4 Low-Temperature Ratings

Pressure ratings for temperatures below  $-29^{\circ}\text{C}$  ( $-20^{\circ}\text{F}$ ) should be determined in accordance with low-temperature properties of gray iron (ASTM A 126) as governed by applicable code or regulation.

### 2.5 Ductility

Gray Iron has little ductility, therefore, the resistance of these flanges and flanged fittings to excessive forces and suddenly applied loads is significantly less than for more ductile materials such as steel. The following precautions are recommended:

(a) These flanges and flanged fittings should not be used where suddenly applied loads such as rapid pressure fluctuation may occur.

(b) Alignment of flange faces is essential along with control of assembly bolt torque so as not to over-stress the gray iron flanges. Care should also be exercised to ensure that piping loads transmitted to gray iron flanges are controlled.

## 3 SIZE

### 3.1 Nominal Pipe Size

As applied in this Standard, the use of the phrase "nominal pipe size" or the designation NPS followed by a dimensionless number is for the purpose of identifying the end connection of piping, flanges, or flanged fittings. The number is not necessarily the same as the flange or flanged fitting inside diameter.

### 3.2 Reducing Fittings

Reducing fittings shall be designated by NPS for the openings in the sequence as indicated in the sketches of Fig. 1.

## 4 MARKING

### 4.1 Fittings

The manufacturer's name or trademark and numerals as shown below for each pressure rating class designation shall be cast on the exterior surface of all fittings.

Class	NPS	Numerals
25	All	25
125	$1 \leq \text{NPS} \leq 12$ $14 \leq \text{NPS} \leq 24$ $30 \leq \text{NPS} \leq 48$	125 100 50
250	$1 \leq \text{NPS} < 12$ $14 \leq \text{NPS} \leq 24$ $30 \leq \text{NPS} \leq 48$	250 200 100

### 4.2 Flanges

The manufacturer's name or trademark shall be cast on all loose flanges. In addition, the numeral 25 shall be cast on Class 25 flanges. Numerals for other classes designations shall be cast on loose flanges in addition to the requirements of para. 4.3.

### 4.3 Material Class

In those sizes and pressure-rating class designations, where ASTM A 126 both Classes A and B iron can be used, see para. 5.1, letter A or B shall be cast on both flanges and fittings in the proximity of the numerals. Flanges and fittings with no A or B Class iron marking shall be considered as Class A iron for rating purposes.

## 5 MATERIALS

### 5.1 Castings

Castings shall meet the requirements of ASTM A 126 for both flanges and flanged fittings, as follows:

Class	NPS	Class of Iron ASTM A 126
25	All	A
125	$1 \leq \text{NPS} \leq 12$ $14 \leq \text{NPS}$	A or B B
250	$1 \leq \text{NPS} \leq 12$ $14 \leq \text{NPS}$	A or B B

### 5.2 Bolting

ASTM A 307 Grade B bolting material is recommended for gray iron flange assembly. Where gray iron flanges are bolted to steel flanges, see ASME B16.5 for bolting limitations.

## 6 FITTING DIMENSIONS AND TOLERANCES

### 6.1 Wall Thickness

It is recognized that some variations are absolutely unavoidable in the making of patterns and castings. Equipment shall be designed to produce wall thicknesses given in the tables. Wall thickness at no point shall be less than 87.5% of the thickness given in the tables.

## 6.2 Facing

(a) Classes 25 and 125 gray iron flanges and flanged fittings shall be flat faced (i.e., without projection or raised face) and finished in accordance with MSS SP-6.

(b) Class 250 flanges and flanged fittings shall have a 2 mm (0.06 in.) raised face of the diameters given in Table 6 and finished in accordance with MSS SP-6. The raised face is included in the minimum flange thickness and center-to-face dimension.

## 6.3 Center-to-Face Dimensions

**6.3.1 Side Outlet Fittings.** Side outlet elbows, side outlet tees, and side outlet crosses shall have all openings on intersecting centerlines. Long-radius elbows with side outlet shall have the side outlet on the radial centerline of the elbow.

### 6.3.2 Elbows

(a) The center-to-face dimensions for straight-size 90 deg elbows, 90 deg long-radius elbows, 45 deg elbows, side-outlet 90 deg elbows, and double-branch elbows are shown in Tables 3, 5, and 7.

(b) Reducing 90 deg elbows, reducing 90 deg long-radius elbows, reducing side-outlet 90 deg elbows, and reducing double-branch elbows shall have the same center-to-face dimensions as straight-size fittings shown in Tables 3, 5, and 7 corresponding to the size of the largest opening.

(c) For 90 deg long-radius elbows with side outlet, the center-to-face dimensions of the side outlet shall be the same as dimension A in Tables 3, 5, and 7 for a straight-size 90 deg elbow corresponding to the size of the largest opening.

(d) Special-degree elbows ranging from 1 deg to 45 deg, inclusive, shall have the same center-to-face dimensions as those for 45 deg elbows; those over 45 deg and up to 90 deg, inclusive, shall have the same center-to-face dimensions as those for 90 deg elbows. The angle designation of an elbow is the angle between the flange faces.

### 6.3.3 Tees, Crosses, and Laterals

(a) The center-to-face dimensions for straight-size tees and crosses, with or without side outlet, and laterals are shown in Tables 3, 5, and 7.

(b) Reducing tees and reducing crosses, with or without side outlet, and reducing laterals, NPS 16 and smaller, shall have the same center-to-face dimensions as straight-size fittings shown in Tables 3, 5, and 7 corresponding to the size of the largest opening. For NPS 18 and larger, if the outlet of a reducing tee; the branch of a reducing lateral; or the largest outlet of a reducing side outlet tee, reducing cross, and reducing side outlet cross is the same size or smaller than given in Tables 3, 5, and 7 (short body pattern), the center-to-face dimensions shown in these Tables shall be used. If a branch or any outlet is larger than shown in Tables 3, 5, and 7, the

center-to-face dimensions shall be the same as for the straight-size fitting shown in Tables 3, 5, and 7 corresponding to the size of the largest opening. Tees, crosses, and laterals, reducing on the run only, shall have the same center-to-face dimensions as straight-size fittings shown in Tables 3, 5, and 7 corresponding to the size of the largest opening.

(c) Tees reducing on both runs are generally known as bull-head tees and have the same center-to-face dimensions as straight-size fittings corresponding to the size of the outlet.

**6.3.4 True Y's.** Center-to-face dimensions for straight-size true Y's are shown in Tables 5 and 7. Reducing sizes are considered special and should be made to suit conditions.

**6.3.5 Reducers and Eccentric Reducers.** The face-to-face dimensions for all reductions of reducers and eccentric reducers shall be the same as given in Tables 5 and 7 for the largest opening.

## 6.4 Center-to-Face Tolerances

The following tolerances shall be permitted on all center-to-contact surface dimensions of fittings: Tolerances for contact surface-to-contact surface dimensions shall be twice those given below. The largest opening in the fitting governs the tolerance to be applied to all openings.

Tolerance		
NPS	mm	in.
≤ 10	± 1.0	± 0.03
≥ 12	± 1.5	± 0.06

## 6.5 Threaded Flanges

**6.5.1 General.** Flanges shall have a Standard Taper Pipe Thread in accordance with ASME B1.20.1. The thread shall be concentric with the axis of the flange, and variations in alignment shall not exceed 5.00 mm/m (0.06 in./ft).

**6.5.2 Class 125.** Threads shall be countersunk a distance not less than one-half of the pitch of the thread at an angle approximately 45 deg with the axis of the thread, for the purpose of easy entrance in making the joint and protection of the threads. Countersinking shall be concentric with the threads. The length of the threads shall be measured to include the countersink.

**6.5.3 Class 250.** Hub may be recessed. When not recessed, threads shall be countersunk a distance not less than one-half of the pitch of the thread at an angle approximately 45 deg with the axis of the thread at the back of the flange. If hub is recessed, threads shall be 45 deg countersunk to diameter of recess. The purpose is for easier entrance in making a joint and for the protection of the threads. Countersinking shall be concentric

with the threads. The length of threads shall be measured to include the countersink.

## 6.6 Flange Bolt Holes

**6.6.1 Flange Bolt Holes.** Flange bolt holes shall be in accordance with the dimensions shown in Tables 2, 4, and 6. Pairs of bolt holes shall straddle the centerline.

**6.6.2 Bolt Circle Diameter.** The required tolerance for a bolt circle diameter is  $\pm 1.5$  mm ( $\pm 0.06$  in.).

**6.6.3 Bolt Hole to Bolt Hole.** The required tolerance for the center-to-center of adjacent bolt hole is  $\pm 0.8$  mm ( $\pm 0.03$  in.).

**6.6.4 Bolt Circle Concentricity.** The required tolerance for concentricity between the flange bolt circle diameter and machined facing diameters are as follows.

NPS $\leq 2\frac{1}{2}$	0.8 mm (0.03 in.)
NPS $\leq 48$	1.5 mm (0.06 in.)

**6.6.5 Tolerance.** Tolerances for sizes larger than NPS 48 shall be as agreed between the Manufacturer and purchaser.

## 6.7 Spot Facing

All flanges and flanged fittings covered by this Standard shall have bearing surfaces for bolting that are parallel to the flange face within 3 deg. Any back facing or spot facing required to accomplish parallelism shall not reduce the flange thickness  $Q$  below the dimensions given in Tables 2 through 7. Flange thickness at any point within the spot face area, as defined in MSS SP-9, shall not exceed the required minimum thickness by more than the following amounts.

NPS	Excess Thickness, mm (in.)
$2 \leq NPS \leq 12$	3.0 (0.12)
$14 \leq NPS \leq 24$	4.5 (0.18)
$30 \leq NPS \leq 96$	6.5 (0.25)

When required, all spot facing shall be done in accordance with MSS SP-9. Sharp corners shall be avoided in back facing.

## 6.8 Crosses and Lateral Reinforcement

Crosses and laterals (Y-branches) both straight and reducing shall be reinforced where necessary to compensate for the inherent weakness in the shape of these fittings.

## 6.9 Drain Connections

**6.9.1 Threaded Connections.** Holes may be drilled and tapped in the wall of fittings if the metal thickness is sufficient to provide the effective length of thread as shown in Fig. 10 and as specified in Table 10. Where thread length is insufficient due to metal thickness or size of tapping is such that reinforcement of opening is

necessary, an integral boss should be added. In no case shall the effective length of thread  $A$  be less than that shown in Table 10. These lengths are equal to the effective thread lengths as shown in ASME B1.20.1.

**6.9.2 Location Designation.** The method of designating the locations of the tapped holes for drains is shown in Fig. 11. Each location is designated by a letter so that desired locations for the various types of fittings may be definitely specified without the use of further sketches or description. For further tapping details, see MSS SP-45.

## 7 BOLT, NUT, AND GASKET DIMENSIONS

### 7.1 Bolting

(a) It is recommended that carbon steel bolts smaller than  $\frac{3}{4}$  in. have (ASME B18.2.1) square heads or (ASME B18.2.1) heavy hex heads, and shall have (ASME B18.2.2) heavy hex nuts.

(b) Carbon steel bolts  $\frac{3}{4}$  in. and larger shall have (ASME B18.2.1) square heads or (ASME B18.2.1) hex heads and shall have (ASME B18.2.2) hex nuts or (ASME B18.2.2) heavy hex nuts or (ASME B18.2.2) square nuts. For bolt sizes  $1\frac{1}{2}$  in. and larger, stud bolts with a nut on each end are recommended.

(c) All bolts or (stud bolts) and all nuts shall be threaded in accordance with the Unified Screw Threads, standard coarse thread series (ASME B1.1) with Class 2A for bolts and Class 2B for nuts.

### 7.2 Gaskets

It is recommended that flat ring gaskets be in accordance with dimensions given in ASME B16.21 for non-metallic gaskets for pipe flanges.

## 8 HYDROSTATIC TESTS

(a) Pressure testing is not required unless specified by the user.

(b) *Fittings.* Fittings shall be capable of withstanding, without showing leaks, the hydrostatic test pressures listed in Table 1 for the material and maximum allowable working pressure of the item tested. These test pressures are 1.5 times the cold working pressure rate rounded to the next higher 0.5 bar (12 psi) in Table 1.

(c) *Flanges.* Flanges integral with or attached to equipment may be hydrostatically tested by the purchaser at his responsibility at pressures higher than specified herein.

## 9 CERTIFICATIONS

The manufacturer shall be able to certify that products are in conformance with the requirements of this Standard when required by the purchase order.

**Table 1 Pressure-Temperature Ratings**

GENERAL NOTE: Pressure is in bar.

NOTES:

- (1) When Class 25 flange or flange fittings are used for gaseous service, the maximum pressure shall be limited to 1.7 bar.
- (2) When Class 250 is used for liquid service, the tabulated pressure shall be used. Class 250: When used for liquid service the tabulated pressure temperature ratings in sizes NPS 14 and larger are applicable to Class 250 flanges only and not to Class 250 fittings.
- (3) 178°C to reflect the temperature of saturated steam at 8.6 bar.
- (4) 208°C to reflect the temperature of saturated steam at 17.2 bar.
- (5) See para. 8.

## GENERAL NOTES:

- The largest opening establishes the basic size of a reducing fitting. The largest opening is named first, except for bull-head tees, which are reducing on both runs, and double-branch elbows where both branches are reducing; the outlet is the largest opening and named last in both cases.
- In designating the openings of reducing fittings, they should be read in the order indicated by the sequence of the letters a, b, c, and d. In designating the outlets of side-outlet reducing fittings, the side outlet is named last; and in the case of the cross (which is not shown), the side outlet is designated by the letter e.

**Fig. 1 Method of Designating Outlets of Reducing Fittings in Specifications**

96	2875	76.2	...	...	2756	1 3/8	68	1 1/4	203

GENERAL NOTE: Dimensions are in millimeters.

## NOTES:

- (1) For facing, see para. 6.2.1.
- (2) Threaded companion flanges should not be thinner than the Class 125 thickness on NPS 24 and smaller. Other types of flanges may have thicknesses as given above.
- (3) The flange diameter, bolt circle, and number of bolts are the same in Class 25 as in Class 125. Bolt hole diameters of Class 25 shall not be modified when mated with Class 125 flanges or with steel flanges.
- (4) For spot facing, see para 6.7.
- (5) For flange bolt holes, see para. 6.6.
- (6) For bolts and nuts, see para. 7.1.

GENERAL NOTE: For dimensions, see Table 3 on next page.

**Fig. 3 Class 25 Flanged Fittings**

60	1854	57.2	35	1524	1118	2007	762	40	838	1041	
72	2197	63.5	41	1829	1346	2388	914	48	1016	1219	

**GENERAL NOTES:**

- (a) Dimensions are in millimeters.
- (b) For facing, see para. 6.2.1.
- (c) For flange bolt holes, refer to Table 2; see also para. 6.6.
- (d) For spot facing, see para. 6.7.
- (e) For intersecting centerlines of side outlets, see para. 6.3.1.
- (f) The flange diameter, bolt circle, and number of bolts are the same in Class 25 as in Class 125. Bolt hole diameters of Class 25 shall not be modified when mated with Class 125 flanges or with steel flanges.
- (g) The center-to-face dimensions of fittings are the same as the Class 125.

**NOTES:**

- (1) For wall thickness tolerance, see para. 6.1.
- (2) For center-to-face dimensions of reducing elbows and side-outlet elbows, see paras. 6.3.2(b) and (c).
- (3) Tees and crosses, reducing on run only, carry same dimensions center-to-face and face-to-face as a straight-size fitting of the larger opening.
- (4) For reinforcement of crosses, see para. 6.8.
- (5) For center-to-face tolerances, see para. 6.4.
- (6) For center-to-face dimensions of special degree elbows, see para. 6.3.2(d).
- (7) Tees, side-outlet tees, and crosses, NPS 16 and smaller reducing on the outlet, have the same dimensions center-to-face and face-to-face as straight-size fittings, corresponding to the size of the larger opening. NPS 18 and larger, reducing on the outlet, are made in two lengths, depending on the size of the outlet as given in Table 3.
- (8) Long-body patterns are used when outlets are larger than given above and, therefore, have the same dimensions as straight-size fittings.
- (9) Fittings reducing on the run only carry same dimensions center-to-face and face-to-face as straight-size fittings, corresponding to the size of the larger opening. Tees increasing on outlet, known as bull-head tees, will have same center-to-face and face-to-face dimensions as a straight fitting of the size of the outlet. For example, an NPS 12 × NPS 18 tee will be governed by the dimensions of the NPS 18 long-body tee, given in Table 3, namely NPS 16½ center-to-face of all openings and NPS 33 face-to-face.
- (10) Side-outlet tees, with outlet at 90 deg or any other angle, straight or reducing, carry same dimensions center-to-face and face-to-face as regular tees having same reductions.
- (11) In a side outlet tee, the larger of the two side outlets governs the center-to-face dimension J.

GENERAL NOTE: For dimensions, see Table 4 on next page.

GENERAL NOTE: Dimensions are in millimeters.

## NOTES:

- (1) For facing, see para. 6.2.1.
- (2) For thread of threaded flanges, see paras. 6.5.1 and 6.5.2.
- (3) All blind flange NPS 12 and larger must be dished with inside radius equal to the port diameter.
- (4) For wall thickness tolerance, see para. 6.1.
- (5) For flange bolt holes, see para. 6.6.
- (6) For spot facing, see para. 6.7.
- (7) For bolts and nuts, see para. 7.1.1.
- (8) Bolt lengths to be compensated for when bolting steel to gray iron flanges.
- (9) NPS 54 through 96 are included for convenience. Pressure-temperature ratings are the user's responsibility.

Fig. 5 Class 125 Flanged Fittings

GENERAL NOTE: For dimensions, see Table 5 on next page.

**Table 5 Dimensions of Class 125 Gray Iron Flanged Fittings (Cont'd)**

GENERAL NOTE: Dimensions are in millimeters.

## NOTES:

- (1) For facing, see para. 6.2.1.
- (2) For flange bolt holes, refer to Table 4 and para. 6.6.
- (3) For spot facing, see para. 6.7.
- (4) For wall thickness tolerances, see para. 6.1.
- (5) For center-to-face tolerances, see para. 6.4.
- (6) For intersecting centerlines of side-outlet fittings, see para. 6.3.1.
- (7) For center-to-face dimensions of reducing elbows and side-outlet elbows, see paras. 6.3.2(b) and (c).
- (8) For center-to-face dimensions of special degree elbows, see para. 6.3.2(d).
- (9) For reinforcement of crosses and laterals, see para. 6.8.
- (10) For face-to-face dimensions of reducers and eccentric reducers, see para. 6.3.5.
- (11) For center-to-face dimensions of tees, and crosses having outlets and laterals having branches larger than given above, see para. 6.3.3(b).
- (12) For center-to-face dimensions of tees, crosses, and laterals reducing on run only, see para. 6.3.3(b).
- (13) For center-to-face dimensions of tees reducing on both runs, known as bull-head tees, see para. 6.3.3(c).
- (14) For center-to-face dimensions of reducing side-outlet tees and crosses having two different size reductions on the outlets, see para. 6.3.3(b).
- (15) Bases are furnished only when specified by the purchaser.
- (16) For tees larger than NPS 24, anchorage fittings are recommended. See Table 8.
- (17) The base dimension applies to all straight and reducing sizes.
- (18) For reducing fittings, the size and center-to-face dimensions of base are determined by the size of the largest opening of the fitting. In the case of reducing base elbows, orders shall specify whether the base shall be opposite the larger or smaller opening.
- (19) Bolt hole template shown for round base is the same as for the flange of the supporting pipe size, except using only four holes in all cases so placed as to straddle centerlines. The bases of these fittings are intended for support in compression and are not to be used for anchors or supports in tension or shear.

GENERAL NOTE: For dimensions, see Table 6 on next page.

NOTE:  
(1) Diameter of raised face has tolerance of  $\pm 0.8$  mm.

48 (9)	1650	101.6	1484	...	...	...	...	...	1543	2 1/4	40	2

GENERAL NOTE: Dimensions are in millimeters.

## NOTES:

- (1) For facing, see para. 6.2.2.  
 (2) All blind flanges for NPS 10 and larger must be dished with inside radius equal to the port diameter.  
 (3) For wall thickness tolerances, see para. 6.1.  
 (4) For thread of threaded flanges, see paras. 6.5.1 and 6.5.3.  
 (5) For flange bolt holes, see para. 6.6.  
 (6) For bolts and nuts, see para. 7.1.  
 (7) For spot facing, see para. 6.7.  
 (8) When bolting to steel flanges, longer bolts or studs shall be used.  
 (9) NPS 36-48 are not produced and used in sufficient quantities to warrant standardization; however, the flange dimensions are included for convenience where special fittings larger than NPS 30 are required. When these fittings are made, the body structure should be designed to be the equivalent of the flanges in service pressure fittings.

**Table 7 Dimensions of Class 250 Gray Iron Flanged Fittings (Cont'd)**

GENERAL NOTE: Dimensions are in millimeters.

## NOTES:

- (1) For facing, see para. 6.2.2.
- (2) For flange bolt holes, refer to Table 6 and para. 6.6.
- (3) For spot facing, see para. 6.7.
- (4) Tolerance of the diameter of the raised face is equal to  $\pm 0.8$  mm.
- (5) For center-to-face tolerances, see para. 6.4.
- (6) For intersecting centerlines of side-outlet fittings, see para. 6.3.1.
- (7) For wall thickness tolerances, see para. 6.1.
- (8) For center-to-face dimensions of reducing elbows and side-outlet elbows, see paras. 6.3.2(b) and (c).
- (9) For center-to-face dimensions of special degree elbows, see para. 6.3.2(d).
- (10) For reinforcement of crosses and laterals, see para. 6.8.
- (11) For center-to-face dimensions of tees and crosses having outlets and laterals having branches larger than given above, see para. 6.3.3(b).
- (12) For face-to-face dimensions of reducers and eccentric reducers, see para. 6.3.5.
- (13) For center-to-face dimensions of tees reducing on both runs, known as bull-head tees, see para. 6.3.3(c).
- (14) For center-to-face dimensions of reducing side-outlet tees and crosses having two different size reductions on the outlet, see para. 6.3.3(b).
- (15) For center-to-face dimensions of tees, crosses, and laterals reducing on run only, see para. 6.3.3(b).
- (16) Bases are furnished only when specified by purchaser.
- (17) The base dimensions apply to all straight and reducing sizes.
- (18) For tees, sizes larger than NPS 24, anchorage fittings are recommended. See Table 9.
- (19) For reducing fittings, the size and center-to-face dimensions of bases are determined by the size of the largest opening of the fitting. In the case of reducing base elbows, orders shall specify whether the base shall be opposite the larger or smaller opening.
- (20) Bolt hole template shown for round base is the same as for the flange of the supporting pipe size, except using only four holes in all cases so placed as to straddle centerlines. The bases of these fittings are intended for support in compression and are not to be used for anchors or supports in tension or shear.

GENERAL NOTE: For dimensions, see Table 8 on next page.

## GENERAL NOTES:

- (a) Dimensions are in millimeters.  
 (b) Bases are furnished only when specified by the purchaser.  
 (c) For tee dimensions, refer to Table 5.

## NOTES:

- (1) For NPS 18 and larger, if the outlet is the same size or smaller than given for reducing tees, the base dimensions shown in this table shall be used. If the outlet is larger than shown for reducing tees, the base dimensions shall be the same as for the straight-size tee, corresponding to the size of the largest opening.  
 (2) Tees reducing on run only shall have the same base dimensions as straight-size tees, corresponding to the size of the largest opening.

GENERAL NOTE: For dimensions, see Table 9 on next page.

## GENERAL NOTES:

- (a) Dimensions are in millimeters.
- (b) For tee dimensions, refer to Table 7.

## NOTES:

- (1) Bases are furnished only when specified by the purchaser.
- (2) For NPS 18 and larger, if the outlet is the same size or smaller than given for reducing tees, the base dimensions shown in this table for reducing tees shall be used. If the outlet is larger than shown for reducing tees, the base dimensions shall be the same as for the straight-size tees, corresponding to the size of the largest opening.
- (3) Tees reducing on run only shall have the same base dimensions as straight-size tees, corresponding to the size of the largest opening.

Fig. 10 Drain Connections

Table 10 Minimum Thread Length

Tap Size, NPS	Thread Length, A, mm
3/8	10.4
1/2	13.5
3/4	14.0
1	17.3
1 1/4	18.0
1 1/2	18.3
2	19.3

GENERAL NOTE: The above sketches show two views of the same fitting and represent fittings with symmetrical shapes, with the exception of the side-outlet elbow and the side-outlet tee (straight sizes).

Hydrostatic Shell Test Pressures [Note (4)]										
100	70	40	270	300	230	230	600	750	450	450

GENERAL NOTE: Pressure is in psi

NOTES:

(1) Limitations:

- (a) Class 25. When Class 25 gray iron flanges and flanged fittings are used for gaseous service, the maximum pressure shall be limited to 25 psi. Tabulated pressure-temperature ratings above 25 psi. for Class 25 gray iron flanges and flanged fittings are applicable for nonshock hydraulic service only.
- (b) Class 250. When used for liquid service, the tabulated pressure-temperature ratings NPS  $\geq$  14 are applicable to Class 250 flanges only and not to Class 250 fittings.
- (2) 353°F to reflect the temperature of saturated steam at 125 psi.
- (3) 406°F to reflect the temperature of saturated steam at 250 psi.
- (4) Hydrostatic tests are not required unless specified by the user.

## GENERAL NOTES:

- The largest opening establishes the basic size of reducing fitting. The largest opening is named first, except for bull-head tees, which are reducing on both runs, and double-branch elbows where both branches are reducing; the outlet is the largest opening and named last in both cases.
- In designating the openings of reducing fittings, they should be read in the order indicated by the sequence of the letters a, b, c, and d. In designating the outlets of side-outlet reducing fittings, the side outlet is named last; and in the case of the cross (which is not shown), the side outlet is designated by the letter e.

**Fig. I-1 Method of Designating Outlets of Reducing Fittings in Specifications**

96	113.25	3.00	...	...	108.50	$1\frac{3}{8}$	68	$1\frac{1}{4}$

GENERAL NOTE: Dimensions are in inches.

## NOTES:

- (1) For facing, see para. 6.2.1.
- (2) Threaded companion flanges should not be thinner than the Class 125 thickness on NPS 24 and smaller. Other types of flanges may have thicknesses as given above.
- (3) The flange diameter, bolt circle, and number of bolts are the same in Class 25 as in Class 125. Bolt hole diameters of Class 25 shall not be modified when mated with Class 125 flanges or with steel flanges.
- (4) For spot facing, see para 6.7.
- (5) For flange bolt holes, see para. 6.6.
- (6) For bolts and nuts, see para. 7.1.

GENERAL NOTE: For dimensions, see Table I-3 on next page.

72	86.50	2.50	1.62	72	53.0	94.00	36.0	48.0	40.0	48.0

## GENERAL NOTES:

- (a) Dimensions are in inches.
- (b) For facing, see para. 6.2.1.
- (c) For flange bolt holes, refer to Table 2; see also para. 6.6.
- (d) For spot facing, see para. 6.7.
- (e) For intersecting centerlines of side outlets, see para. 6.3.1.
- (f) The flange diameter, bolt circle, and number of bolts are the same in Class 25 as in Class 125. Bolt hole diameters of Class 25 shall not be modified when mated with Class 125 flanges or with steel flanges.
- (g) The center-to-face dimensions of fittings are the same as the Class 125.

## NOTES:

- (1) For wall thickness tolerance, see para. 6.1.
- (2) For center-to-face dimensions of reducing elbows and side-outlet elbows, see paras. 6.3.2(b) and (c).
- (3) Tees and crosses, reducing on run only, carry same dimensions center-to-face and face-to-face as a straight-size fitting of the larger opening.
- (4) For reinforcement of crosses, see para. 6.8.
- (5) For center-to-face tolerances, see para. 6.4.
- (6) For center-to-face dimensions of special degree elbows, see para. 6.3.2(d).
- (7) Tees, side-outlet tees, and crosses, NPS 16 and smaller, reducing on the outlet, have the same dimensions center-to-face and face-to-face as straight-size fittings, corresponding to the size of the larger opening. NPS 18 and larger, reducing on the outlet, are made in two lengths, depending on the size of the outlet as given in Table I-3.
- (8) Long-body patterns are used when outlets are larger than given above and, therefore, have the same dimensions as straight-size fittings.
- (9) Fittings reducing on the run only carry same dimensions center-to-face and face-to-face as straight-size fittings, corresponding to the size of the larger opening. Tees increasing on outlet, known as bull-head tees, will have same center-to-face and face-to-face dimensions as a straight fitting of the size of the outlet. For example, an NPS 12 × NPS 12 × NPS 18 tee will be governed by the dimensions of the NPS 18 long-body tee, given in Table I-3, namely NPS 16½ center-to-face of all openings and NPS 33 face-to-face.
- (10) Side-outlet tees, with outlet at 90 deg or any other angle, straight or reducing, carry same dimensions center-to-face and face-to-face as regular tees having same reductions.
- (11) In a side-outlet tee, the larger of the two side outlets governs the center-to-face dimension J.

GENERAL NOTE: For dimensions, see Table I-4 on next page.

GENERAL NOTE: Dimensions are in inches.

## NOTES:

- (1) For facing, see para. 6.2.1.
- (2) For thread of threaded flanges, see paras. 6.5.1 and 6.5.2.
- (3) All blind flanges NPS 12 and larger must be dished with inside radius equal to the port diameter.
- (4) For wall thickness tolerance, see para. 6.1.
- (5) For flange bolt holes, see para. 6.6.
- (6) For spot facing, see para. 6.7.
- (7) For bolts and nuts, see para. 7.1.
- (8) Bolt lengths to be compensated for when bolting steel to cast iron flanges.
- (9) NPS 54 through 96 are included for convenience. Pressure-temperature ratings are the user's responsibility.

ASME B16.1-2005 PDF of ASME B16.1-2005

**Table I-5 Dimensions of Class 125 Gray Iron Flanged Fittings (Cont'd)**

GENERAL NOTE: Dimensions are in inches.

NOTES:

- (1) For facing, see para. 6.2.1.
- (2) For flange bolt holes, refer to Table I-4 and para. 6.6.
- (3) For spot facing, see para. 6.7.
- (4) For wall thickness tolerances, see para. 6.1.
- (5) For center-to-face tolerances, see para. 6.4.
- (6) For intersecting centerlines of side-outlet fittings, see para. 6.3.1.
- (7) For center-to-face dimensions of reducing elbows and side-outlet elbows, see paras. 6.3.2(b) and (c).
- (8) For center-to-face dimensions of special degree elbows, see para. 6.3.2(d).
- (9) For reinforcement of crosses and laterals, see para. 6.8.
- (10) For face-to-face dimensions of reducers and eccentric reducers, see para. 6.3.5.
- (11) For center-to-face dimensions of tees and crosses having outlets and laterals having branches larger than given above, see para. 6.3.3(b).
- (12) For center-to-face dimensions of tees, crosses, and laterals reducing on run only, see para. 6.3.3(b).
- (13) For center-to-face dimensions of tees reducing on both runs, known as bull-head tees, see para. 6.3.3(b).
- (14) For center-to-face dimensions of reducing side-outlet tees and crosses having two different size reductions on the outlets, see para. 6.3.3(b).
- (15) For reducing fittings, the size and center-to-face dimensions of basee are determined by the size of the largest opening of the fitting. In the case of reducing base elbows, orders shall specify whether the base shall be opposite the larger or smaller opening.
- (16) Bolt hole template shown for round base is the same as for the flange of the supporting pipe size, except using only four holes in all cases so placed as to straddle centerlines. The bases of these fittings are intended for support in compression and are not to be used for anchors or supports in tension or shear.
- (17) Bases are furnished only when specified by the purchaser.
- (18) For tees, sizes larger than 24 in., anchorage fittings are recommended. See Table I-8.
- (19) The base dimension applies to all straight and reducing sizes.

Fig. I-6 Class 250 Flanges

GENERAL NOTE: For dimensions, see Table I-6 on next page.

NOTE:

- (1) Diameter of raised face has tolerance of  $\pm 0.03$  in.

**Table I-6 Class 250 Flange and Bolting Dimensions**

NPS	Flange, Q	Flanges			Blind Flanges [Note (2)]			Hubs			Bolting [Note (6)]				
		Diameter of Flange, Min., Q	Thickness of Raised Facing, W	Diameter of Port, I	Diameter of Wall V	Thickness, Min., X	Diameter of Hub, Min., Y	Length Through Hub, Min., T	Length of Threads, Min., T	Diameter of Bolt Holes Circle	Diameter of Bolt Holes Circle	Number of Bolts	Diameter of Bolts [Note (7)]	Length of Bolts [Note (8)]	Length of Stud Bolts [Note (8)]

GENERAL NOTE: Dimensions are in inches.

## NOTES:

- (1) For facings, see para. 6.2.2.
- (2) All blind flanges for NPS 10 and larger must be dished with inside radius equal to the port diameter.
- (3) For wall thickness tolerance, see para. 6.1.
- (4) For thread of threaded flanges, see paras. 6.5.1 and 6.5.3.
- (5) For flange bolt holes, see para. 6.6.
- (6) For bolts and nuts, see para. 7.1.
- (7) For spot facing, see para. 6.7.
- (8) When bolting to steel flanges, longer bolts or studs shall be used.
- (9) Fittings in these sizes are not produced and used in sufficient quantities to warrant standardization; however, the flange dimensions are included for convenience where special fittings larger than NPS 30 are required. When these fittings are made, the body structure should be designed to be the equivalent of the flanges in service pressure ratings.

Fig. I-7 Class 250 Flanged Fittings

GENERAL NOTE: For dimensions, see Table I-7 on next page.
