## Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see [www.iso.org/directives](http://www.iso.org/directives)).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see [www.iso.org/patents](http://www.iso.org/patents)).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the WTO principles in the Technical Barriers to Trade (TBT) see the following URL: Foreword - Supplementary information

The committee responsible for this document is ISO/TC 61 *Plastics*, Subcommittee SC 12, *Thermosetting materials*.

This third edition cancels and replaces the second edition (ISO 4895:1997), which has been technically revised.

## Introduction

The tendency of liquid epoxy resins to crystallize varies depending on factors such as basic composition, purity, additives, homogeneity and water content, in addition to external factors such as storage history and ambient temperature.

As it is rather difficult to indicate the tendency quantitatively by observation and comparison, the tendency is therefore to express the results by observing, at intervals, the changes in fluidity and appearance of samples.

# Plastics — Liquid epoxy resins — Determination of tendency to crystallize

**SAFETY STATEMENT** — Persons using this document should be familiar with normal laboratory practice, if applicable. This document does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user to establish appropriate safety and health practices and to ensure compliance with any regulatory requirements.

## 1 Scope

This International Standard specifies a method for determining the tendency of liquid epoxy resins to crystallize. The tendency to crystallize is determined by observing, at specified time intervals, changes in fluidity and the onset of crystallization.

## 2 Normative references

The following documents, in whole or in part, are normatively referenced in this document and are indispensable for its application. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 6353-2:1983, *Reagents for chemical analysis — Part 2: Specifications — First series*

ISO 6353-3:1987, *Reagents for chemical analysis — Part 3: Specifications — Second series*

## 3 Principle

Calcium carbonate powder is mixed with the liquid epoxy resin dissolved in ethanol. The mixture is kept at a specified low temperature and observed at specified time intervals to compare the changes in fluidity and crystallization.

## 4 Reagents

**4.1 Calcium carbonate**, as specified in ISO 6353-3:1987, R 53.

**4.2 Ethanol**, as specified in ISO 6353-2:1983, R 11.

## 5 Apparatus

**5.1 Refrigerator or cold enclosure**, maintained at  $(10 \pm 2) ^\circ\text{C}$ .

**5.2 Glass test tube**, of capacity approximately 100 ml, 40 mm in diameter and 80 mm in height, with a polyethylene-covered stopper.

**5.3 Glass rod**, of hard glass, approximately 10 mm in diameter.

**5.4 Oven**.

**5.5 Analytical balance**, accurate to 0,01g.

**5.6 Constant temperature room** maintained at  $(23 \pm 5)^\circ\text{C}$ .

## 6 Procedure

**6.1** Weigh 20 g of liquid epoxy resin into the test tube (5.2).

**6.2** Stopper the test tube and place it in the oven (5.4) at  $(60 \pm 2)^\circ\text{C}$  for 16 h.

**6.3** Cool the test tube to room temperature  $[(23 \pm 5)^\circ\text{C}]$  in the constant temperature room (5.6), add 20 g of calcium carbonate (4.1) and 2 g of ethanol (4.2), and mix the sample thoroughly with the glass rod for 2 min.

**6.4** Stopper the test tube again and place it in the vertical position in the refrigerator or cold enclosure (5.1) at  $(10 \pm 2)^\circ\text{C}$ .

**6.5** Observe the sample twice a day at a specified time (for example at an interval of 8 h during the day and 16 h during the night):

- to start at 9 am;
- to carry out first observation at 5 pm;
- to carry out second observation at 9 am (next day);
- to carry out third observation at 5 pm (next day);
- to carry out fourth observation at 9 am (the day after).

Observe the sample in the following way.

Allow the test tube to warm to room temperature  $[(23 \pm 5)^\circ\text{C}]$  in the constant temperature room (5.6), then place it in the horizontal position and leave it for 1 min.

- When the distance of movement of the liquid surface tip (L in Figure 1) is 10 mm and more, record “a”.
- When the distance of movement of the liquid surface tip (L in Figure 1) is less than 10 mm, record “b”.
- When the sample has completely solidified due to crystallization, record “c”.

**Figure 1 — Observation of samples**

After each observation, if the sample has not yet crystallized, mix thoroughly with the glass rod for 2 min and place into refrigerator until next observation.

Record the number of days which elapse to each stage of crystallization (see Figure 2).
